TITLE: Heat and mass transfer in the flow of heated air past the surfaces of viscous multicomponent liquids

SOURCE: Teplo- i massoperenos. t. II: Teplo- i massoperenos pri vzaimodeystvii tel s potokami zhidkostey i gazov (Heat and mass transfer. v. 2: Heat and mass transfer in the interaction of bodies with liquid and gas flows). Minsk, Nauka i tekhnika, 1965, 290-298

TOPIC TAGS: heat transfer, mass transfer, evaporation

ABSTRACT: A special experimental unit was built to study mass and heat transfer in the flow of heated air past the surface of a solution of phenol-formaldehyde resin in ethyl alcohol under hydrodynamic conditions corresponding to those in the industrial process. The article gives a scheme of the equipment. It consisted basically of an open aerodynamic tube through which air was blown by a centrifugal blower. The experimental section was a rectangular channel with dimensions of 0.140 x 0.150 m^2. The lower wall of the channel was made in the form of a bath 0.937 meters long, 0.140 meters wide, and 0.015 meters deep. The following

Card 1/2

L 24337-66

ACC NR: AT6006915

quantities were measured experimentally: the distribution of the dynamic pressures and temperatures of the gas flow; the concentrations of the evaporating component in the boundary layer on the surface of the liquid under investigation at 6 cross sections along the length of the channel; the statistical pressures at 6 cross sections; the temperature of the surface of the liquid at 3 cross sections; the temperature of the channel walls at 2 cross sections; the amount of liquid evaporated. The experiments were made over a range of Reynolds numbers from 1.46×10^4 to 2.50×10^4. The temperature of the air stream varied from 338 to 388°K, and the temperature of the liquid surface from 303 to 328°K. The results showed that with an increase in evaporation the coefficient of friction falls. Under the observed conditions, this fall attained 19%. A figure shows the dependence of St_D on the parameters determined. With a scatter of ± 8.8%, the experimental points are approximated by the exponential relationship:

$$St_D = 0{,}0057\, Re^{-0.2} (\bar{T}_\infty)^{-0.5} (\bar{P}_\infty)^{0.1}.$$

The constant coefficient and the power exponents were calculated by the method of least squares. Orig. art. has: 2 figures.

TITLE: Preservation and storage of communication equipment

SOURCE: Tekhnika i vooruzheniye, no. 7, 1966, 54-61

TOPIC TAGS: communication equipment, equipment preservation, equipment storage, silica gel

ABSTRACT: Methods of protecting communication equipment by means of silica gel against high relative humidity are recommended. The equipment is stored with the silica gel under a sealed cover made of organic film of low penetrability. Calculations and experiments have demonstrated that in the moderate climate of central USSR covers made of a 0.15-mm thick polyethylene film preserves equipment for about three years if it is covered with 1 to 1.2 kg of silica gel for each

Card 1/2

L 44414-66

ACC NR: AP6024902

1 m^2 of the cover surface. It is recommended that the polyethylene film of the cover should be 0.15—0.2 mm thick. All the apertures and slots of automobile and armored transport bodies are plastered with a water resistant material and 1.0—1.5 kg of silica gel for each 1 m^2 of the sealed surface is placed inside the body. This method is used for communication equipment inside the automobiles. The automobiles themselves should be kept in unheated sheds. Tank gauze, tank glue, and polyethylene tape are used as sealing materials. The relative humidity is checked by the color of the silica gel inside the body which turns rose when the humidity reaches about 55%. In general, the permissible humidity for any method of preservation should not exceed 55%. When this limit is exceeded the moist silica gel has to be replaced. Orig. art. has: 4 figures. [DW]

TITLE: Asymmetry of neutrons from μ-meson reaction in lead

PERIODICAL: Referativnyy zhurnal. Fizika, no. 6, 1961, 77, abstract 6B250 ("Tr. Mezhdunar. konferentsii po kosmich. lucham, 1959, v. 2", Moscow, AN SSSR, 1960, 346)

TEXT: Asymmetry in neutron distribution produced in weak interaction of (μ^-, n) type relative to direction of a μ-meson flux was studied on cosmic μ-mesons. The installation was located at an altitude of 3,860 m above sea level under a 7-m thick ground layer and consisted of two sections of neutron counters immersed into paraffin and separated by a 330-kg heavy lead block. Experiments discovered an excess of upward neutrons, i.e., opposite to direction of the μ-meson flux, and the ratio of upward neutrons to downward ones was 1.186 ± 0.024. It follows hence that the quantity $P\beta\alpha = 0.09 \pm 0.01$, where P is meson polarization degree, equal to 0.15-0.20; α is coefficient of asymmetry; β is a quantity dependent on the properties of the nucleus.

TITLE: Errors in numerical forecasts of AT500 and AT850 charts as related to circulatory conditions

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy*, no. 151, 1964. Voprosy* chislennogo analiza i prognoza pogody* (Problems in numerical analysis and forecasting), 60-76

TOPIC TAGS: meteorology, weather forecasting, short-range weather forecasting, atmospheric circulation, numerical weather forecasting, atmospheric pressure

ABSTRACT: Many numerical weather forecasting methods have been developed for predicting atmospheric pressure but none give sufficiently reliable results. Certain similarity criteria now are being used in numerical forecasting and the circulation type is taken into account in certain methods, but this particular aspect of the problem has been studied inadequately. The limited attention given to the use of appropriate circulation-type analogues has come from specialists in long-range forecasting, and their experience is applicable only to a limited degree to shortrange forecasting. This paper is therefore

Card 1/2

ACCESSION NR: AT4043148

a study of methods for the objective determination of analogues and possible ways to use analogues in hydrodynamic weather forecasting. A review of the Soviet and foreign literature on this subject is given. The author then investigates errors in numerical forecasts using 40 forecasts of the AT850 and AT500 fields prepared at the Glavnaya geofizicheskaya observatoriya (Main Geophysical Observatory) for 1 and 2 days in advance. Analysis of the field of errors was made at 91 grid points. The M. I. Yudin forecasting method had been used in these forecasts (Tr. GGO, No. 71, 1957; Tr. TsIP, No. 106, 1960). Certain aspects of this method are reviewed. When the entire series of forecasts was analyzed it was not possible to detect a systematic error, but when the series was broken down into three circulation groups for the initial day (westerly, easterly and meridional in the G. Ya. Vangengeym classification) it was found that systematic errors of considerable value could be detected for each group. Orig. art. has: 6 formulas, 3 figures and 3 tables.

Abstract : 2) on the basis of indications practiced in productive conditions of the collective farm. Tests proved that the first variant is preferable in water expenditure, in securing optimal soil humidity conditions during cotton plant vegetation, and in the size of the pre-frost and total yield of raw cotton.

TITLE: Electron gun with high current stability

SOURCE: Svarochnoye proizvodstvo, no. 8, 1965, 37-38

TOPIC TAGS: welding, electron beam welding, welding gun, electron gun, gun cathode, tantalum cathode

ABSTRACT: A new type of electron gun for vacuum electron-beam welding has been developed. This gun is equipped with a disk-shaped tantalum cathode 1 mm thick and 8 mm in diameter, with a system for stabilizing the beam current within ±0.5 mamp. The gun operates with an accelerating voltage of up to 50 kv. At 50 kv a beam current of over 80 mamp can be obtained. At a voltage of 40 kv and a beam current of 110—130 mamp, the beam diameter in the welding plane is 0.5—0.7 mm. Under these conditions the depth of penetration in AMts aluminum alloy is 25 mm at a weld width of 2.5 mm. The use of a cathode made of pure tantalum instead of lanthanum hexaboride extends the service life of the gun and improves its reliability. Orig. art. has: 4 figures. [ND]

Polishing Surfaces up to 10th and 11th Class of Surface Quality. G. F. Kudasov and M. Ya. Dubovyk. (*Stanki i Instrument*, 1951, (9), 27-28). [In Russian]. The use of abrasive-impregnated flexible rubber discs for producing surface qualities of the '10th and 11th' class on steel is described, with special reference to the manufacture of bearings. Optimum abrasive grain size was found to depend on initial surface quality, further reduction of grain size gave no corresponding improvement in surface quality. Graphs of resultant surface quality against disc speed, time of polishing, abrasive grain size and bearing size, respectively, are given. Flexible discs, because of the high working pressure required, give good results only with very rigid polishing machines.—S. K.

TITLE: Quality Improvement in Machining High-speed Grinding Wheels (Povysheniye kachestva mekhanicheskoy obrabotki skorostnykh shlifoval'nykh krugov)

PERIODICAL: Abrazivy, 1956, Nr 15, pp.28-34

ABSTRACT: Grinding wheels for high-speed grinding must be of increased accuracy. The precision of a grinding wheel is basically determined by the accuracy of its hole, its eccentricity to the external surface and by the non-parallelism of the faces. To meet these high requirements with respect to the hole size and its eccentricity towards the external surface, the boring technique with the use of limit gages is introduced. The high-accuracy in the non-parallelism of face surfaces is obtained by finishing the grinding wheels on surface-profile grinders. A table of tolerances for the dimensions of high-speed and regular grinding wheels is provided, also - the results of investigation in accuracy of commercial grinding wheels.
